

hmap::Vec2< int >

std::vector< float >

shape

vector

hmap::Array

```
graph BT; hmapArray[hmap::Array] -.->|shape| hmapVec2[hmap::Vec2< int >]; hmapArray -.->|vector| stdVector[std::vector< float >];
```

The diagram illustrates a class hierarchy where `hmap::Array` is the base class. Two dashed purple arrows originate from `hmap::Array` and point to `hmap::Vec2< int >` and `std::vector< float >`. The arrow to `hmap::Vec2< int >` is labeled 'shape', and the arrow to `std::vector< float >` is labeled 'vector'.
